

Passenger Information Forecast

Passengers know what to expect.

The Passenger Information Forecast generates accurate predictions for arrival and departure times, and also evaluates connecting services. By intelligently processing millions of real-time and historical data points, it provides reliable forecasts that enable consistent passenger information across the entire travel chain.

Key Features:

- **AI-powered forecasting models** analyze real-time traffic conditions and operational dependencies across the rail network, generating around 150 million forecasts every day for accurate and timely passenger information.
- **Reliable, network-wide forecasts** support both passenger guidance and operational decision-making.
- **Non-discriminatory access to data** ensures that all railway undertakings can benefit from a shared, consistent information base across applications and channels.

Reliable forecasts for better orientation and greater travel confidence.
